AMENDMENT

10 In response to the Office Actions dated March 23, April 26,
and June 9, 2004, in Application No.10/089,142 please amend the
claims as follows:

Claim 1 (currently amended): A method of forming a
continuous composite structure including the steps of preselecting
a first liquid reactive resin forming material, a particulate
15 solid additive material and a porous blanket, mixing said additive
particles with said first liquid resin forming material
substantially continuously to form a substantially uniform mixture
thereof, encapsulating substantially all of said additive
particles with said first liquid resin forming material, advancing
20 said porous blanket through said liquid resin/additive mixture,
migrating part of said mixture through said blanket substantially
uniformly to form a continuous resin matrix within said blanket
[with] and to form adhesive outer surfaces on said blanket,
[applying a thin coating of a preselected sustantially immediately
25 curing resin forming material over a final base substrate surface,
advancing said coated martix/blanket into a final configerung
on said oated base surface, applying pressure to said coated
matrix/blanket to tightly affix said coated matrix/blanket to said
coated base surface and form a water impervious structure
30 thereon.] preselecting a second resin forming material which
substantially cures immediately upon application, applying a thin
coating of said second resin forming material over substantially
one major adhesive upper surface of said matrix/blanket to form
a coated matrix/blanket while allowing an area of said adhesive
35 surface to remain exposed along one edge of said upper surface
thereof, positioning a first preselected length of said coated
matrix/blanket into a preselected final configuration while it is
flexible and has an adhesive lower surface and an exposed adhesive
